Functions and Signals

INHIBIT signal

The **INHIBIT** signal is used to turn the power supply ON and OFF.

TTL “1” or OPEN – will turn on the power supply (For normal operation leave the signal not connected).

TTL “0” – will turn off the power supply.

SYNC signal

The SYNC signal is used to allow the power supply frequency to sync with the system frequency.

The system frequency can be 250 kHz \pm 10 kHz.

When not connected, the power supply will work at internal frequency, close to 250 kHz \pm 10 kHz.

SIGNAL RTN

The SIGNAL RTN is used as grounding for **SYNC** and **INHIBIT** signals.

This is referenced to the **VIN RTN** pin.

VOUT SENSE

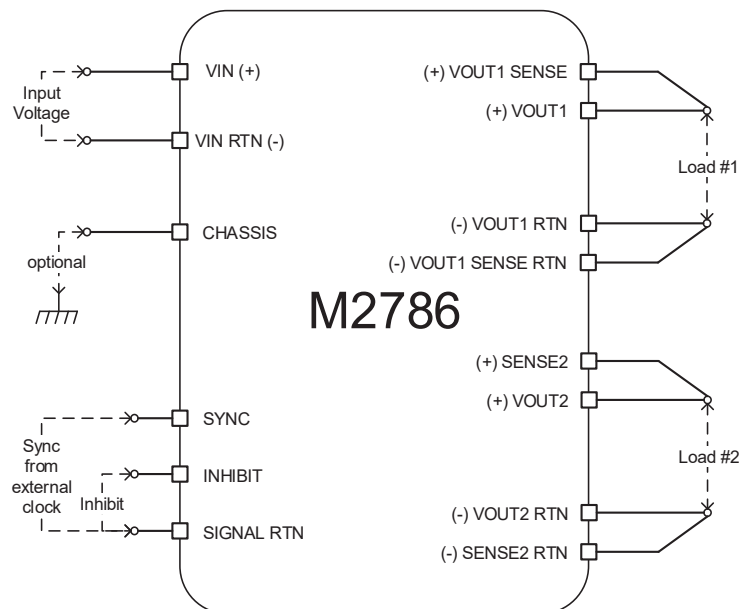

The **SENSE** is used to achieve accurate load regulation at the load terminals. This is done by connecting these pins directly to their respective load terminals. The use of remote sense has a limit of voltage dropout between converter’s output and load terminals of 2-10% of voltage output.

When not used connect **SENSE** to **VOUT** and **SENSE RTN** to **VOUT RTN** for each of the outputs.

Chassis PIN

This chassis pin allows connection of the unit chassis to system chassis.
