Functions and Signals

INHIBIT

The **INHIBIT** signal is used to turn the power supply ON and OFF.

TTL “1” or OPEN – Power supply is ON (For normal operation, leave this pin unconnected.) TTL “0” or SHORT to **SIGNAL RTN** – Power supply is OFF.

SYNC

The **SYNC** signal is used to allow the power supply's switching frequency to sync with the system clock. The external clock's frequency can be $250\text{ kHz} \pm 10\text{ kHz}$.

When this pin is left open (unconnected) the power supply will synchronize to its internal clock, set at $250\text{ kHz} \pm 10\text{ kHz}$

SIGNAL RTN

The **SIGNAL RTN** is used as a return path for the **SYNC** and **INHIBIT** signals. This pin is referenced to **VIN RTN**.

SENSE

The SENSE line is used to achieve accurate voltage regulation at load terminals. To use this feature, connect this pin directly to load's positive terminal. The use of remote sense has limit of voltage dropout between converter's output and load terminals of typical 5% or 0.5v the lesser of the two.

If this function is not required, short **SENSE** pin to **OUTPUT** pins as close as possible to the unit.

SENSE RTN

The SENSE RTN line is used to achieve accurate voltage regulation at load terminals. To use this feature, connect this pin directly to load's negative terminal. The use of remote sense has limit of voltage dropout between converter's output and load terminals of typical 5% or 0.5v the lesser of the two. If this function is not required, short **SENSE RTN** pin to **OUTPUT RTN** pins as close as possible to the unit.
